**“In vitro cultures of the porcine respiratory tract and their susceptibility to influenza A viruses”**

Sjouke Van Poucke - Kristien Van Reeth  
ESNIP Minisymposium-Gent 2008

---

---

---

---

---

---

---

---

- 1) Introduction
- 2) Optimalization of an in vitro system
- 3) Susceptibility to influenza A viruses
- 4) Receptor expression
- 5) Future plans
- 6) General conclusions

---

---

---

---

---

---

---

---

**1. Introduction**

- Avian IVs in pigs-”in vivo experiments”
  - Susceptible to most avian subtypes
  - Infection and replication less efficient
  - Large variations between pigs
  - No/inefficient pig to pig transmission

→ **STRONG SPECIES BARRIER !**

---

---

---

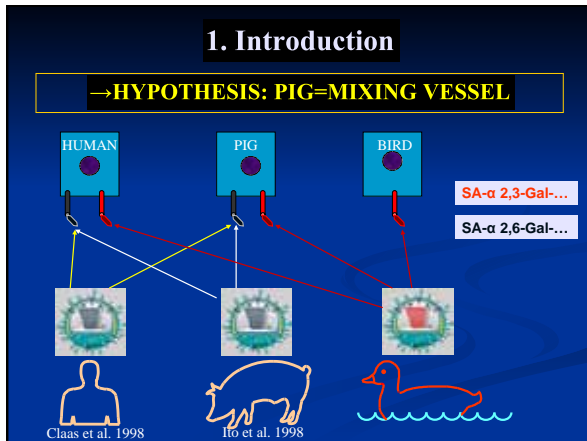

---

---

---

---

---

---

---

---

---

---

---

---

---

- ### 1. Introduction
- AIMS:**
- Set up of the in vitro system→EXPLANTS
    - ENTIRE respiratory tract
    - Maximum similarity to in vivo situation
    - Follow up in time of virus yield
    - Well controlled conditions
  - Susceptibility of explants to influenza A viruses
  - Receptor expression and relationship with replication capacity

---

---

---

---

---

---

---

---

### 2. Optimization of an in vitro system

■ 2A) Materials and methods:

- Piglets 6 weeks old
- Conventional – swine influenza virus seronegative (H1N1, H3N2 and H1N2)
- Euthanasia by thiopental and exsanguination
- Upper and lower respiratory tract:
  - 1) Respiratory part of the nasal mucosa
  - 2) Trachea
  - 3) Bronchi
  - 4) Right apical lung lobe

1  
2  
3  
4

---

---

---

---

---

---

---

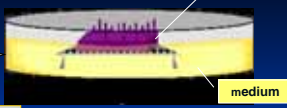

---

### 2. Optimization of an in vitro system

➤ 2A) Materials and methods

- 1) Respiratory part of the nasal mucosa
- 2) Trachea

Glorieux et al. 2007

3) Bronchi

4) Right apical lung lobe filled with agarose

Porro et al. 2001

Labels: explant, medium

---

---

---

---

---

---

---

---

### 2. Optimization of an in vitro system

■ 2B) Viability parameters

- Ciliary beating (light microscopy)
- Ethidium monoazide bromide staining (counterstained with Hoechst) specific for necrotic and late apoptotic cells by DNA-binding.
- TUNEL staining for early and late apoptotic cells by labeling of DNA strand breaks.

---

---

---

---

---

---

---

---

### 2. Optimization of an in vitro system

■ Result 1:

- Cultivation system covering the upper and lower porcine respiratory tract
- Good viability

---

---

---

---

---

---

---

---

### 3. Susceptibility to influenza A viruses

■ 3A) Materials and methods

The viruses:

Swine influenza viruses

- Sw/Belgium/1/98 (H1N1)
- Sw/Flanders/1/98 (H3N2)
- Sw/Gent/7625/99 (H1N2)

Human influenza viruses

- A/New Caledonia/20/99 (H1N1)
- A/Panama/2007/99 (H3N2)

Avian influenza viruses

- Mallard/Alberta/290/98 (H1N1-LPAI)
- Mallard/Italy/3401/2005 (H5N1-LPAI)
- Duck/Belgium/06936/05 (H3N6-LPAI)
- Chicken/Belgium/150/99 (H5N2-LPAI)
- Chicken/Italy/1067/V99 (H7N1-LPAI)

---

---

---

---

---

---

---

---

---

---

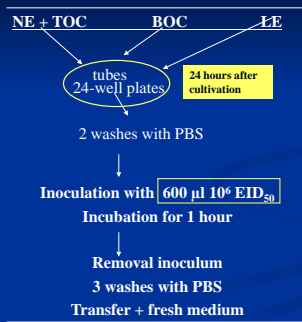

---

---

### 3. Susceptibility to influenza A viruses

■ 3A) Materials and methods

Procedures:

---

---

---

---

---

---

---

---

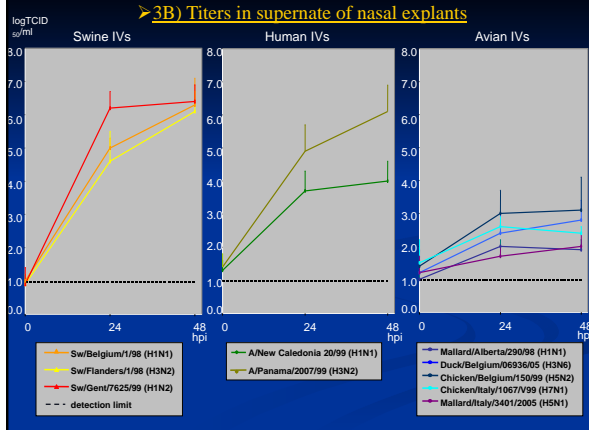

---

---

---

---

➤ 3B) Titers in supernate of nasal explants

---

---

---

---

---

---

---

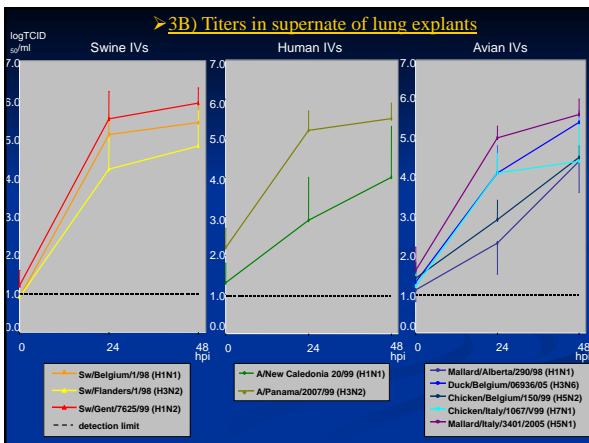

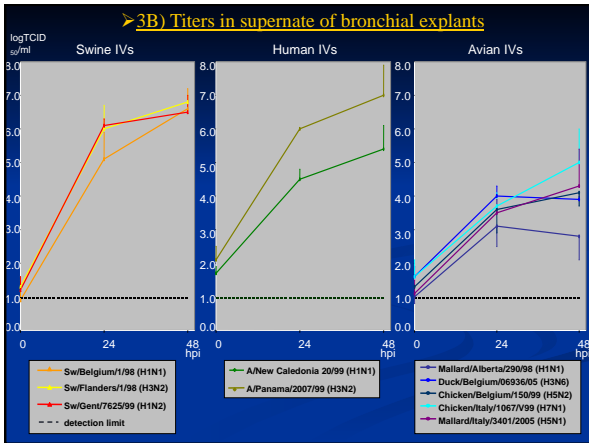

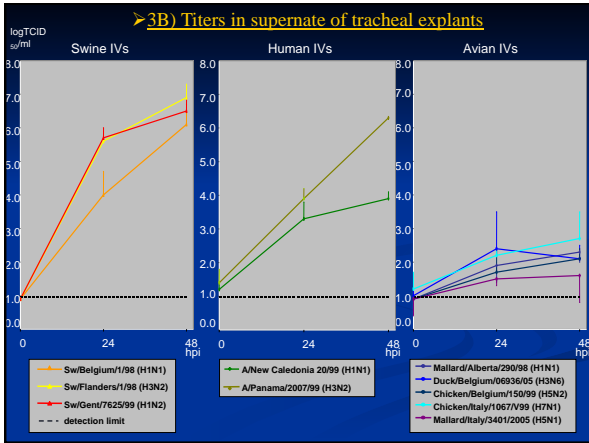

---

---

---

---

---

### 3. Susceptibility to influenza A viruses

- Result 2:
  - All influenza viruses from the 3 different hosts do replicate in the 4 types of explants.
  - The in vitro systems appear to be suitable to study **differences in replication capacity** of genetically distinct influenza viruses.
  - **Avian** influenza viruses replicate best in **lower respiratory tract**.

---

---

---

---

---

---

---

---

### 4. Receptor expression

➤4A) Materials and methods

Lectine	Receptor	Substrate
Digoxigenin SNA (glycan differentiation kit: Roche)	Neu5Ac $\alpha$ (2-6) Gal $\beta$ (1-4)Glc  ~HUMAN/SWINE IVs	NF: red
Biotinylated MAA1 (Vectorlab)	Neu5Ac $\alpha$ (2-3)Gal $\beta$ (1-4)Glc  ~AVIAN IVs	AEC: brown
Biotinylated MAA2 (Vectorlab)	Neu5Ac $\alpha$ (2-3)Gal $\beta$ (1-3)Gal  ~AVIAN IVs	AEC: brown

---

---

---

---

---

---

---

---

➤4B) Receptor expression in nasal explants

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

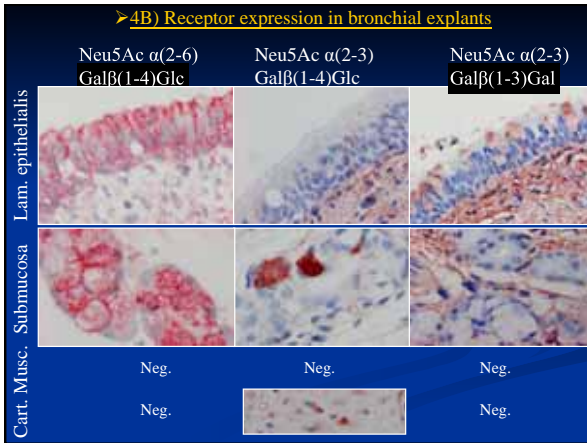

---

---

---

---

---

---

---

---

---

---

---

---

---

### 4. Receptor expression

■ **Summary**

	SA $\alpha$ 2,6	SA $\alpha$ 2,3	
NE	+++	+/-	+/-: Very limited expression
TOC	+++	+/-	+: Moderate expression
BOC	+++	+	++: Clear expression
LE	++	++	+++: Abundant expression

■ **Remarks**

- MAA 1 and MAA 2 lectines should be combined to study SA- $\alpha$ 2,3 expression.

---

---

---

---

---

---

---

---

---

---

### 4. Receptor expression

■ **Result 3:**

- Although presence of both receptor types, clear difference in **expression level and pattern** between SA- $\alpha$ (2,6) and SA- $\alpha$ (2,3)!!:
  - Human/swine influenza virus receptor in the entire respiratory tract.
  - Avian influenza virus receptor concentrated in the lower respiratory tract.
- **Consistency** between virus yield and receptor expression in the explants.

---

---

---

---

---

---

---

---

---

---

### 5. Future plans

- Colocalization of virus infected cells and receptors.
  - Early phase of infection
- Differences in tissue and cell tropism
  - Cell markers
- Effect of mutations in receptor binding site on efficiency of virus replication
  - Matrosovich M. (Philipps University-Germany)

---

---

---

---

---

---

---

---

---

---

### 6. General conclusions

- Good **CORRELATION** between “in vivo” and “in vitro” results:
  - Low replication capacity of AIVs in upper respiratory tract → possible explanation for failure of pig to pig transmissions after intranasal inoculation
  - Preference of AIVs for the lower respiratory tract
  - No indications for a higher sensitivity of pigs to AIVs than humans (Nicholls et al. 2007)

---

---

---

---

---

---

---

---

### 6. General conclusions

- Possibilities of the “in vivo” and “in vitro” systems are **COMPLEMENTARY**:
  - Insight virus-cell interactions at different levels: in vitro
  - Outcome of infection in the host: in vivo
  - Impact of host factors, e.g.: immunity, genetic background,...: in vivo

---

---

---

---

---

---

---

---
